Electrolytes are defined as those compounds which can dissociates generating ions in solution or melt, it gains the ability to conduct electricity.

What is electrolytes?

An electrolyte is just a chemical substance that conducts electricity either melted or mixed into a solution by forming ions. Sodium chloride is an example of an electrolyte. Any molten or dissolved chemical substance that ionizes and conducts electricity.

What is solution?

A solution is a homogenous mixture of two components, usually a solute and a solvent. A solution can be found in any of the three states of matter: liquid, solid, or gas. The solute and solvent are the two components that make up the solution.
